

# High Performance Plug Fans

Impeller with true airfoil blades

Issue 1.9 EN

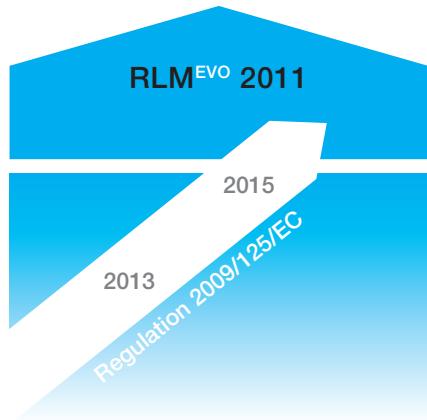

**RLM EVO**

**NICOTRA|Gebhardt**  
fan|tastic solutions

Overall static efficiency

## Ready for the next generation

We have accelerated impeller technology with the RLM Evo series, the new generation in our plug fan range. The result: More efficiency and reduced turbulent conditions. And that is highly effective as the Evo series ensures:

- ▶ lower energy consumption
- ▶ lower costs
- ▶ lower noise levels

### Nicotra Gebhardt – the professionals in profiling

Nicotra Gebhardt is the first port of call for profiled impeller blades. We brought the first hollow section airfoil blades onto the market in 1975. Since then we have been achieving the absolutely best efficiencies in our fans in every application. Our engineers and technicians use the latest simulation programmes to develop and test new designs. You can rely on the knowledge and experience of specialists.

### Don't wait until 2015

Fans must reach ever higher system efficiencies. The EU's ErP directive will prescribe compulsory values in 2013 and will increase them again in 2015. The new generation of plug fans by Nicotra Gebhardt, already achieved higher efficiency in 2011 than that required as from 2015.

## The plus factors of the new Generation

### ▶ Unparalleled system efficiency for plug fans

The Evo series sets a new standard in efficiency. No other plug fan reaches higher system efficiency.

### ▶ Innovative blade and impeller shaped for highest efficiencies

The entire shape of the impeller was optimised using a real turbulence profile for the blades. This ensures that the impeller reaches as yet unparalleled high efficiency and takes the top position in aerodynamics.

### ▶ Optimal pressure and turbulence conditions

The re-designed impeller shape makes optimal pressure and minimised turbulence conditions in the impeller possible. The inclined leading edge of the blade builds pressure more evenly minimising entry and exit losses.

### ▶ Low operating cost brushless DC motor

The brushless DC motor used by Nicotra Gebhardt is markedly more efficient than conventional drives: It reduces the energy consumption of the fan for partial loads by up to 50 %.

### ▶ Much quieter

Thanks to their new design the blades and the impeller run with less noise. The entire fan is thus much quieter.

### ▶ Easy to integrate

Despite their improved performance figures, the Evo series have the same external dimensions and significant operational data as earlier generations of plug fans. They can therefore be easily and quickly exchanged in existing systems or integrated in available machine concepts.

### ▶ Easy maintenance

Thanks to the construction method and direct drive the Evo series is practically maintenance-free.

## The evolutionary elements

### ► The perfect profile

At the heart of the Evo series are the six blades with rounded inclined leading edges and re-designed hollow profile.

They ensure minimised turbulence conditions in the impeller thus enabling the extraordinary high efficiency of the fan.

Due to their special shape, the blades build up pressure evenly at all sections. The result: Air circulates around the blades better and the turbulence tends to dissipate. This increases not only efficiency but also causes significantly lower noise.

### ► The innovative high performance impeller

The re-designed high performance impeller makes the Evo series unbeatable in matters of efficiency. To ensure this we optimised the entire shape.

The special shape of the cover disc alone greatly improves turbulence. The width and diameter of the impeller are in an ideal ratio to each other.

The new hollow profile of the blades ensured that the weight of the impeller could be markedly reduced and that, at the same time, a high degree of stability could be reached. Pressure losses on entry were greatly decreased.

And at the exit, where losses had been sustained before, the new impeller shape ensures additional available static pressure.

### ► The tailored drive

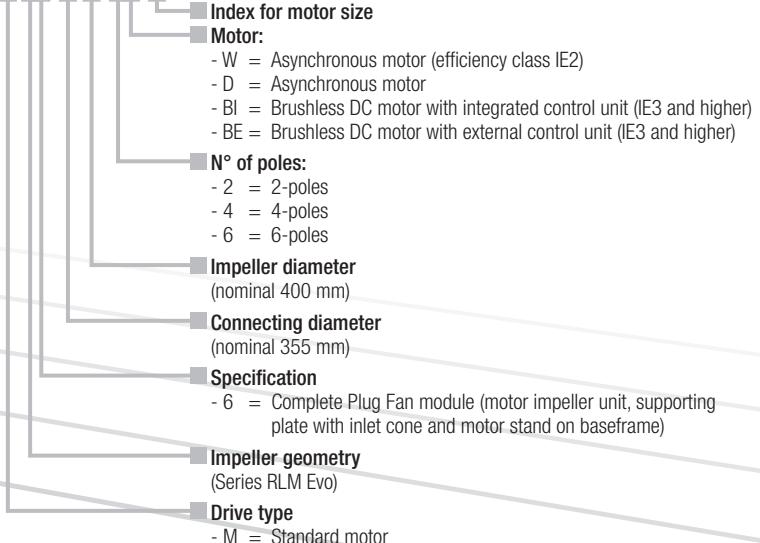

The new generation of our plug fans not only have a perfect impeller but also a precisely matched drive. For this reason, the Evo series, already an innovation in itself, is available with a cutting edge brushless DC motors. Together with such a drive, the Evo series delivers high performance with particularly low energy consumption. Whether during start-up or under base, partial or full load, the efficiency exceeds that of a conventional AC motor in every situation.

Our drives with brushless DCs reach efficiencies of efficiency class IE3 and higher.

#### Type code

The type code of every fan is composed as follows. Example:

\* Motor for operation with inverter only (No mains operation).  
We recommend: Danfoss VLT HVAC Drive FC-100.

### Fan type code

W = Asynchronous motor according to efficiency class IE2 (High Efficiency)

BE = Brushless DC motor with external control unit (efficiency class IE3 and higher)

## Dimensions in mm, subject to change.

Motor **	k <sub>max</sub>	w

## Performance charts

$$\rho_1 = 1.20 \text{ kg/m}^3$$

Please note coloured area!  
— Asynchronous motors

## System efficiencies

### Comparison system efficiencies $\eta_{sys}$ (impeller, motor, inverter)

<b>RLM E6-9010-</b>		$\eta_{sa}$	65	70	75	<b>77</b>	75	70	60	%
<b>6W-34</b>	1235 1/min	$\eta_{se}$	58	62	66	<b>68</b>	66	62	53	%

## Formula symbols

$\eta_{se}$  = overall static efficiency (impeller, motor, inverter)

$\eta_{sa}$  = fan shaft static efficiency

$L_{WA6}$  = A-weighted sound power level at discharge

$P_a$  = fan shaft power

Das Herstellungsjahr des Ventilators ist auf dem jeweiligen Typschild des Produktes aufgeführt.

Nicotra Gebhardt GmbH, Gebhardistraße 19-25, 74638 Waldenburg, HRB 727753

Information on recycling and disposal is provided in the operating instruction.

The measurements do not use components which are not part of the fan.

**RLM E6-2528/-9010**

**EVOLUTION  
IS IN THE AIR**  
**RLM<sup>EVO</sup>**

**Specification**

**EVOLUTION  
IS IN THE AIR**  
**RLM<sup>EVO</sup>**

**Plug fan with direct drive RLM Evo**

Complete assembly module with highest system efficiency, specifically developed and optimized for use without a spiral casing and designed for use with a horizontal axis. Newly developed high performance impeller with optimized shape and highest efficiency, comprising six backward curved hollow section true aerofoil blades with real turbulence profile and rounded, inclined blade leading edges, from impeller shroud to backplate, for optimal impact over the entire width of the blade.

Co-rotating radial diffuser with optimized exit curving on the cover disc to enhance efficiency.

Impeller made of high tensile sheet steel in an automated manufacturing process, robotic welding, degreased, iron phosphated and coated with a high quality epoxy-polyester mixed powder, fastened with a clamping bush to the shaft of the motor, balanced statically and dynamically according to ISO 1940, specification G2.5, based on the maximum speed from size 4550.

System inlet cone made of galvanized sheet steel for optimal inflow to the impeller, equipped with flow measuring device IMV as a standard feature.

Attached internal rotor motor (mounting arrangement type IM B3) with efficient asynchronous technology (IE2) with 3 PTCs suitable for operation on the frequency inverter or with highly efficient permanent magnet technology (IE3 and higher) – optimally coordinated with the high performance impeller.

Equipped on inlet side with connection possibility for quadratic supports.

Complete module optimally adjusted, built to a common base frame prepared for vibration decoupling.

Impeller-Performance data to tolerance class 1 according to DIN 24166.

**Variants (at choice)**

- ▶ with standard internal rotor motor with asynchronous technology (IE2)
- ▶ with internal rotor motor with permanent magnet technology (IE3 and higher)
  - with integrated control unit (series: BI)
  - with external control unit (series: BE)

**Fan Data**

Fan type	RLM E6-	
Volume flow	$q_v$	$\text{m}^3/\text{h}$
Fan static pressure	$p_{sf}$	Pa
Air density at inlet	$\rho_1$	$\text{kg/m}^3$
Media temperature	t	$^\circ\text{C}$
Fan power	P <sub>a</sub>	kW
Efficiency	$\eta_{sa}$	Hz
speed	N	1/min
Max. fan speed	N <sub>max</sub>	1/min
Frequency	f	Hz
Max. operating frequency	f <sub>max</sub>	Hz
Sound power level (A weighted)	L <sub>WA</sub>	dB
Weight	m	kg

**Fittings / Accessories**

- ▶ Mating flange
- ▶ Inlet connection (flexible)
- ▶ Protection guard for inlet
- ▶ Anti vibration mounts (spring diffusors)
- ▶ Inverter for AC motors (Unit with Filter and Control Panel)
- ▶ Inverter for brushless DC motors (Unit with Filter, Line Choke and Control Panel)
- ▶ Line choke
- ▶ Universal control device
- ▶ Differential pressure sensor

**Description**

$$\eta_{se} = \eta_F \cdot \eta_M \cdot \eta_{sa}$$

$$P_e = \frac{q_v \cdot p_{sf}}{\eta_{se}}$$

The system efficiency is the product of the efficiencies of the frequency inverter, motor and impeller.

The electric power of the fan taken from the mains can be determined with the system efficiency.

**Performance data**

The performance curves of the fans are determined at the plenum test rig according to ISO 5801, measured in installation „A“.

The curves show a free discharge pressure rise  $p_{sf}$  as a function of the volume flow rate  $q_v$  in double logarithmic grid distribution. The resistant curves appear as straight lines.

The fan curves are related to a reference density of  $\rho_1 = 1.2 \text{ kg/m}^3$  at the fan intake. The pressure and impeller power are directly proportional to the density  $\rho_1$ .

The efficiencies  $\eta_{sa}$  given in the performance curves are only valid for the impeller.

The performance data of the RLM centrifugal fans are classified in precision class 1 according to DIN 24166 "Fans, technical delivery conditions".

**Sounds**

$$L_{WA5} = L_{WA6} - \Delta L_{WA}$$

$q_{vopt}$	$\leq 0.85$	$> 0.85$
$\Delta L_{WA}$	4 dB	5 dB

Sound measurement and analysis are carried out in accordance with DIN 45635-38 "Sound measurement at machines; fans".

In the performance maps the A sound power level  $L_{WA6}$  is stated as emission parameter for the discharge side.

The value for the inlet side  $L_{WA5}$  can be calculated with the stated formula.

**Inlet side**

$$L_{Wfc5} = L_{WA5} + L_{Wrel5}$$

Relative sound power level for inlet side  $L_{Wrel5}$  at octave centre frequencies  $f_c$ .

**Anti Vibration Mounts**

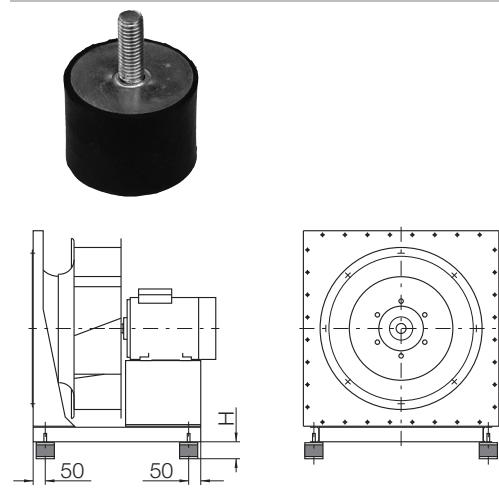

AV mounts are designed to prevent noise and vibrations being transmitted through the base of the fan.

AV mounts should be mounted beneath the fan base frame so the weight and spring deflections are evenly distributed. They should not be mounted symmetrically because a counter force is induced into the system by the pressure created by the working fan.

It is difficult for the manufacturer to establish the position of the AV mounts to suit all types of application.

Vibration and noise insulation can also be improved by ensuring that the fan is connected to its external environment by a flexible coupling.

*Available AV mounts for different fans, see proSELECTA II.  
The AVM-mounts are supplied with the suitable mounting material for the base frame.*

**Rubber Buffers**

**Rubber buffers** for noise insulation only.

**Volumeter**

$$q_V = K \times \sqrt{\frac{2}{\rho} \times \Delta p_{DÜ}}$$

pressure tappings in inlet cones

The fans are equipped with a flow measuring device as standard. With the flow measuring device it is possible to measure/monitor the flow easily after the fan is installed.

For pressure measurement A pressure tapping at a predetermined position on the inlet cone is provided whereby the decrease in pressure created by the cone can be measured. The decrease in pressure measured can be inserted in the following formula.

- $q_V$  Volume flow  $\text{m}^3/\text{h}$
- $K$  calibration factor  $\text{m}^2\text{s}/\text{h}$
- $\rho$  density of media  $\text{kg}/\text{m}^3$
- $\Delta p_{DÜ}$  pressure difference at cone Pa

The K factor is determined by comparative measurement on a standard test ring.

When fans are built in a plenum, it is required to measure the differential pressure between the static pressure in the plenum on the suction side and the pressure at the inlet cone.

To ensure that the static pressure to be measured at the inlet nozzle is not distorted by dynamic velocities, it is recommended to attach a ring of points on the wall as shown in the following diagram.

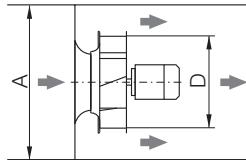

If the differential pressure is conducted via a pressure sensor, the signal can also be used for controlling.

Detailed description, measurement and connection diagram available on request.

**Calibration factors**

## Correction of design for installation in an enclosure

Installing the fan in a casing may result in a reduced flow rate and pressure increase relative to the information in the performance map which is determined freely discharging in accordance with the prescribed standards.

The pressure loss can be calculated as a function of the size of the casing with the loss coefficient  $\zeta$  for the installed casing from the following diagram. The values in the diagram apply when the box sections are quadratic and the impeller is laid out symmetrically (inflow and outflow according to the diagram).

If casings with rectangular sections are used the following approximate values can be used for box size A:

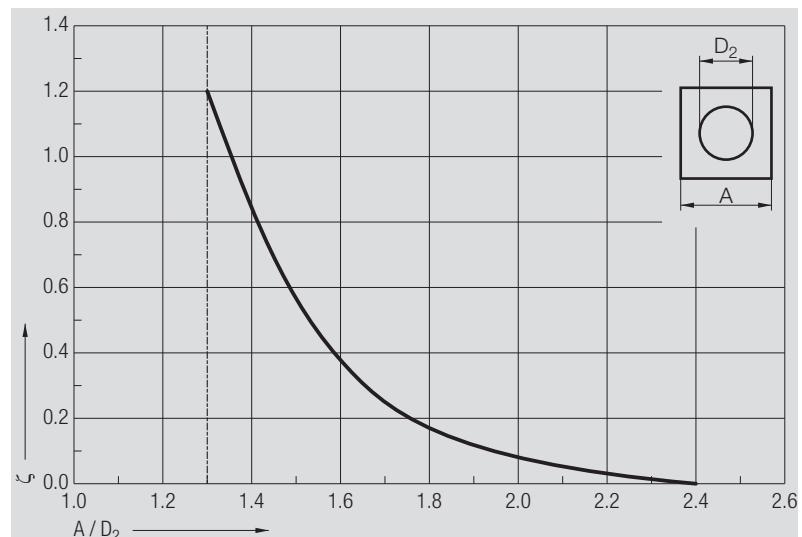

$\zeta$	Loss coefficient for casing installation
A	Inside casing width or length
$D_2$	Throat plate diameter

► Max. side length  $B_{\max}$  / min. side length  $B_{\min} \leq 1.3$ :

$$A = \sqrt{B_{\max} \cdot B_{\min}}$$

► Max. side length  $B_{\max}$  / min. side length  $B_{\min} > 1.3$ :

$$A = 1.14 \cdot B_{\min}$$

If the impeller is laid out asymmetrically, the loss coefficients are up to 20 % higher. A minimum distance of the impeller to the surrounding wall of  $0.15 \cdot D_2$  must be observed.

The pressure loss is calculated with the loss coefficient determined in accordance with the following formula:

$$p_V = 100200 \cdot \zeta \cdot \rho \frac{q_V^2}{D_2^4}$$

The throat plate diameters for the calculation can be taken from the respective dimension diagram of the fan. The pressure loss is added to the desired pressure increase in the operating point and the fan is selected with the corrected value.

$p_V$	Pressure loss in Pa
$\zeta$	Loss coefficient for casing installation
$\rho$	Reference density of conveyed air (usually: 1.2 kg/m³)
$q_V$	Flow rate in m³/h
$D_2$	Throat plate diameter in mm
